

Synthetic Lab Report

Patient and Specimen Information

Patient Information	Provider Information	Specimen Information
Name: Jane Q. Sample	Provider: Dr. Avery Sterling	Specimen ID: SYN-992834-X
DOB: 05/12/1972	Facility: Aurora Health Institute	Collection Date: Aug 7, 2026
Sex: Female	Location: Silver City, NM	Received Date: Aug 8, 2026
Patient ID: P-44556677	NPI: 1234567890	Report Date: Aug 14, 2026

Test Result Summary

Result: Cancer Signal Detected

A cancer signal was detected in this blood sample. This result indicates that cell-free DNA (cfDNA) methylation patterns associated with cancer were identified. Further clinical evaluation, such as imaging or other diagnostic tests, is required to confirm the presence of cancer and determine the location.

Cancer Signal Origin (CSO) Prediction

The Galleri test provides a prediction of the tissue of origin for the detected cancer signal. One or two Top-Ranked Cancer Signal Origins are reported.

Priority	Predicted Cancer Signal Origin	Accuracy Frequency
Origin 1	Lung	85%
Origin 2	Pancreas	12%

Clinical Interpretation

The "Cancer Signal Detected" result is not a diagnosis of cancer. It means that genomic signals often associated with malignancy were found. The predicted origins (Lung and Pancreas) should guide the subsequent diagnostic workup.

It is recommended that the healthcare provider initiate targeted clinical evaluations, which may include:

- High-resolution imaging (e.g., CT, MRI, or PET-CT) of the chest and abdomen.
- Specialist consultation with oncology or pulmonology.
- Tissue biopsy if a suspicious lesion is identified via imaging.

Methodology and Limitations

Methodology: This test utilizes next-generation sequencing (NGS) to analyze specific methylation patterns of cell-free DNA (cfDNA) in the blood. The Galleri test uses a machine-learning algorithm to identify patterns characteristic of over 50 types of cancer and to predict the most likely organ of origin.

Limitations:

- A "Cancer Signal Detected" result is not a definitive diagnosis and can be a false positive.
- A "Cancer Signal Not Detected" result does not rule out the presence of cancer.

- This test is intended for use in adults at elevated risk for cancer, such as those aged 50 or older.
- The test does not detect all cancers and is not a replacement for standard-of-care screenings (e.g., mammography, colonoscopy).

Laboratory Authorization

This synthetic report is for educational and illustrative purposes only.
